

Prompt 1

Goal:

We are building a personal wealth application, that can serve multiple individual users.

Some very important boundaries:

the load will be very small, like 1 user pr. day, not more than 1-100 users. We want to host this with railway.com – and do not want to spend more than 5-10 USD pr. month for the hosting in the start up phase. There is a strict limit for 100 users in the start, to avoid misuse – that might change over time.

Some guide lines:

We want to use Human Interface Guidelines (HIG) from apple as design guideline for the app, so the app feels familiar and compelling. There probably is a skill that can handle this important part.

<https://developer.apple.com/design/human-interface-guidelines/patterns>

The ideal user is middleclass – with a pension, house, kids and some goals. We design not for performance, but for UI experience. We want low operating cost.

Below from a previous version

The UI is fixed, so the user can not drag objects around, key elements are mentioned below.

Key app layout:

One page “Financial planner dashboard” , “user name” , “country”

Top row, large font: networth, assets, liabilities, cashflow

Second row: 5 goals with doughnut diagram,

1 “point mark” diagram showing key wealth data over time.

The apps key element are “blocks” with key wealth arrears. In each block there is a sum (as result of the elements of the block), and the user can add / delete rows in each block, and each row is

Identifier ; value (a number - can be negative, but rounded to nearest 100, Details (30 characters)

Each block has 1 row prepopulated with “example”, “1.000”, “example text”

Blocks ::

- A. Highly liquid assets. Cash, savings and other readily accessible assets
- A2. Short term debt. Short term borrowing and credit balance.

- B. Assets less liquid, debtors
B2, Short term debt
- C. Longer term investment, realestate and alternative assets
C2, debt linked to longer term assets
C3, potential tax linked to longer term investments
- D. Personal home, lifestyle and key personal assets
D2 Mortgage and debt linked to key personal assets
- E. Pension / retirement and other reserves
- F. Planned investments, gifts and purchase

Earnings:

- J. Salary and income
- K. Monthly expenses
- L. Savings

Goals:

(not defined yet)

Networth is calculated as : Assets - liabilities

Assets is calculated as : $A+b+c+d+e$

Liabilities is calculated as $A2+b2+c2+c3+d2$

Cashnow is calculated as $J+k$

Individual user wealth records

The “individual wealth record” is the most important data in the app. We expect that each user has not more than 50-200- records (rows), with not more than 3 datapoints pr. row.

Important that the end users work is saved when they make a change to their personal wealth record. It is important that users individual wealth record” does not get mixed up.

Login and security:

new users can login to the app with their e-mail adress, and a password. In case they forgot their password, they must be able to get a reminder mail. Users must have accepted a mail before they can save their data.

User choose country when the create a login / user - countries can be “DK”, “SE”, “NO”, “FI”, “UK” - and currency is dependent on country £ for UK, “KR” for SE, NO, DK, “€” for FI.

Backoffice

While we are building the app, there must be a back-office button - where we can delete user, and see how many rows they have, and 2-3 datapoints from the wealth table. (i.e. networth, e-mail, and number of rows on the individual user wealth record)
